Security Tips to Keep You Safe Online

1 Don't Plug In Unknown USB Devices

USB drives can carry malware. Only use approved equipment.

2 Use Your Own Login, Don't Share Credentials

Even if it's faster to share, this puts the whole system at risk.

3 Lock Your Screen Before You Walk Away

Hit **Ctrl + Alt + Delete** (Windows) or **Control + Command + Q** (Mac) to lock up.

4 Watch for Weird Messages or Alerts

If your computer or machine shows a strange pop-up or error—report it immediately.

5 Only Use Approved Software & Tools

Don't install apps, visit unknown websites, or plug in personal devices.

6 Double-Check Emails Before Clicking Links

Emails pretending to be from the boss or IT might be phishing attempts.

7 Keep Factory Equipment Software Updated

If you're told an update is needed—don't delay. Old systems can be hacked.

8 Don't Let Strangers in the Building or Shop Floor

Even if they say they're "here for maintenance"—check with your supervisor.

9 Report Lost or Stolen Devices Right Away

Whether it's a phone, tablet, or laptop, even one missing device can be a big risk.

10 Ask If You're Not Sure

If something seems off—ask IT, security, or a supervisor. Better safe than sorry.
